

PRECOTE 30

Precote is a family of adhesives and sealants for chemical microencapsulated screws, used for the possibility of locking and sealing with rapid and controlled hardening, constant friction and resistance to vibration from -50°C to 170°C.

Available with different resistances, Precote is ideal for metal threads, with each type of surface coating, from M3 screw (external threads) and from M6 for the nuts (internal threads).

Precote is suitable for threads with components in separate microcapsules, to achieve greater durability, at least 3 years, and integrity during storage, because is not affected by humidity, eliminating the need for additional fastening systems.
